What's New in EFAS Data Validation in Meteo DCC

**EFAS Annual Meeting 2023** 

Presented by Carina-Denise Lemke and Zora Schirmeister 29 09 2023

#### 🔊 📕 Data Validation in Meteorological Data Collection Center

 Meteo Data Collection Center checks incoming observation data using different quality checks, e.g.

- Distance validation  $\rightarrow$  time distance between two values, data availability
- Min/max validation  $\rightarrow$  values against min/max thresholds
- Rate of change validation → rate of change between two values against max thresholds
- Resulting quality flags decide whether data are used for MDCC products or not

## A Data Validation in Meteorological Data Collection Center

Specific min/max validation rules

- Seasonally varying thresholds for min/max temperature
- Thresholds for precipitation totals
- Thresholds are very tolerant to avoid excluding real extremes

www.efas.ei

| Parameter     | Min threshold | Max threshold | Unit        |
|---------------|---------------|---------------|-------------|
| Precipitation | 0             | 125           | mm/15 min   |
| Precipitation | 0             | 200           | mm/30 min   |
| Precipitation | 0             | 250           | mm/60 min   |
| Precipitation | 0             | 350           | mm/180 min  |
| Precipitation | 0             | 425           | mm/360 min  |
| Precipitation | 0             | 475           | mm/540 min  |
| Precipitation | 0             | 500           | mm/720 min  |
| Precipitation | 0             | 525           | mm/900 min  |
| Precipitation | 0             | 550           | mm/1080 min |
| Precipitation | 0             | 600           | mm/1440 min |

## 🔊 🐂 Data Validation in Meteorological Data Collection Center

• Shortcomings

Kasse

- No geographical and few seasonal context:
  - Same thresholds for all stations in data base (e.g. North vs. South Europe)
  - No seasonal dependencies used for precipitation (e.g. ,rain season' vs. ,dry season')
- Validation of individual time series
  - No information from neighboring stations
- Measures currently being setup
  - Introduction of climate zones and seasonally varying thresholds
  - Introduction of spatial comparison checks

# 🔊 🐂 Meteo Data Validation: Thresholds by Climate Zone and Season

ergency agement

Kasse

www.efas.eu

- Introduction of climate zones and seasonally varying thresholds
  - Example: Air temperature

**KISTERS** 

**Deutscher Wetterdienst** 

pernicus

European

Commission

- Goal:
  - Adapt limits to local climate / Reduce limit range
  - Don't flag real extremes

#### 🔊 🔚 Meteo Data Validation: Thresholds by Climate Zone and Season

• Approach

Kace

www.efas.eu

- Clever grouping of stations by similar geographical characteristics
  → using climate zones
- Köppen-Geiger Climate Classification based on temperature and precipitation characteristics
- Using data set provided by University of Veterinary Medicine, Vienna, based on CRU and GPCC data

European

## 🔊 🖥 Meteo Data Validation: Thresholds by Climate Zone and Season

Definition of new thresholds

- Group stations by climate zones and calculate thresholds for each group
  - $\rightarrow$  adds regional dependency
- Separate percentile for each day → adds seasonal dependency

www.efas.eu

Example Air Temperature climate zone Dfc

### Meteo Data Validation: Thresholds by Climate Zone and Season

- Some results
- Region A: rejected before 6875 Region B: rejected before 23104

## Meteo Data Validation: Flatliner Detection

- Introduction of flatliner detection for different parameters
- Objective

Kasse

www.efas.eu

• Check on consecutive equal values that exceed a plausible time period

## Meteo Data Validation: Flatliner Detection

- Introduction of flatliner detection for different parameters
- Objective
  - Check on consecutive equal values that exceed a plausible time period
- Estimate plausible time periods of consecutive equal values
  - Precipitation: long dry periods
    - Define length depending on climate zone
  - Planned: Temperature / Relative Air Humidity / Dew point temperature
    - Shorter time periods than for precipitation
    - Depending on temporal resolution of timeseries (e.g. 1 hour / 6 hours / 24 hours...)

#### 🔊 🐂 Meteo Data Validation: Spatial Comparison

- Introduction of spatial validation checks
- Objective

Kasse

www.efas.eu

- Use measurements from neighboring stations to assess the quality of an isolated observation
- Identification of neighbours
  - Search radius: 50 km
  - Priority radius: 30 km
  - Use at least 3 and not more than 8 neighboring stations
  - Prioritize use of stations from every cardinal directions

## 🔊 🐂 Meteo Data Validation: Spatial Comparison

- Spatial Comparison
- Identifies stations with unusually high precipitation if neighbours show significantly less rain
- Flags such incidents and excludes those from usage in METEO products

Kasse

www.efas.eu

# 🔊 🖕 Meteo Data Validation: Spatial Zero Comparison

- Spatial Zero Comparison
- Identifies stations with zero precipitation if neighbours show significant rain
- Flags such incidents and excludes those from usage in METEO products

Kasse

www.efas.eu

# 🔊 📕 Meteo Data Validation: Status & Outlook

- Seasonally varying thresholds per climate zone
  - Statistical calculations of thresholds finished
  - Integration into production is ongoing
- Flatliner detection
  - Implementation into production ongoing for precipitation
  - Other parameters planned

#### • Spatial comparison for precipitation

- Software development finished
- Integration into production in near future
- Expected Results

www.efas.eu

- Better identification of issues in observation data
- Better quality of data products created at Meteo DCC
- Better quality of the historical database that is used for the calibration of the hydrological model in EFAS5
